Sections

Text that can be split into paragraphs, based on if there is a blank line between character groups.

Sub Sections

- Bulleted lists
- That are able to handel sub lists, or multiple paragraphs for every entry based on the preceading whitespace.
  1. Numbered lists
  2. That are automatically enumerated.

Some ability to do **Bold** text and *italic* or *italic* text would be good, aswell as combinations of the two. Also lets add in `inline` code, and $math$. there is always some fun in having math workng. Then there sould also be outof line

```
#include <iostream>
```

code that can be based on the laguages specivied. Aswll as outof line math

$$mathequationsandstuff$$

.

In the future I would like to implement definition lists symbolized by adding a colon to the end of a line, and the following indented lines are the definition.

Everything sould be nestable, so that anything can have anything else nested within it.
